

Question 1

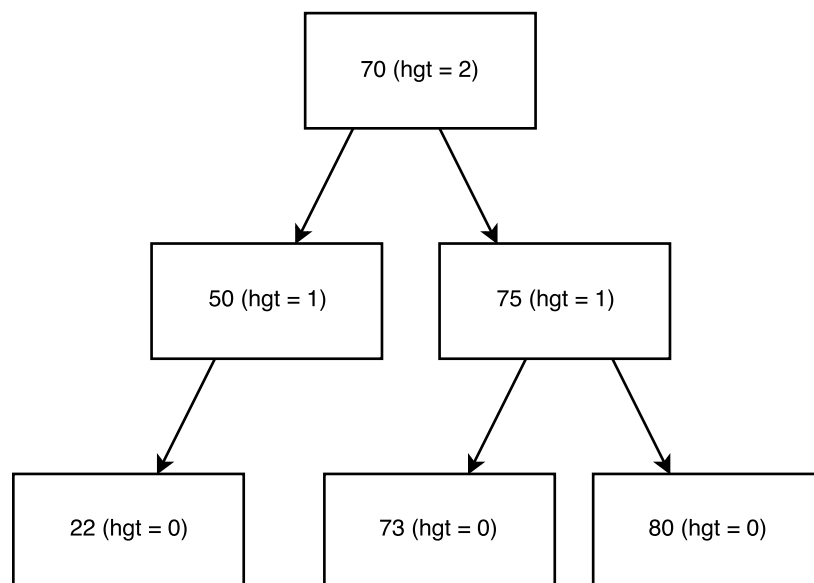

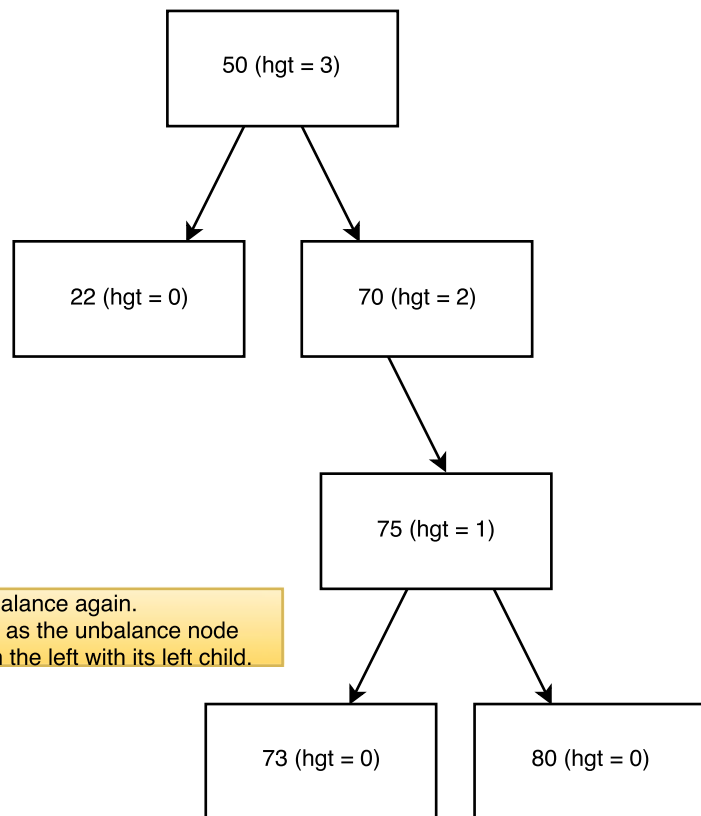

Question 2

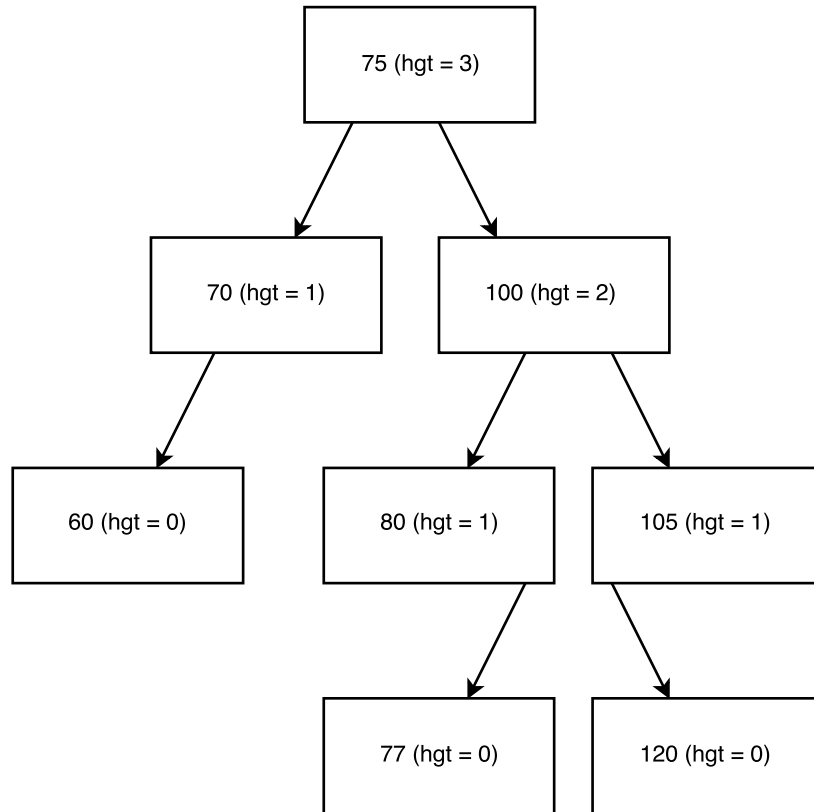

Adding 73 makes this tree unbalance again.  
We need double rotation here, as the unbalance node  
is on the right but is heavier on the left with its left child.

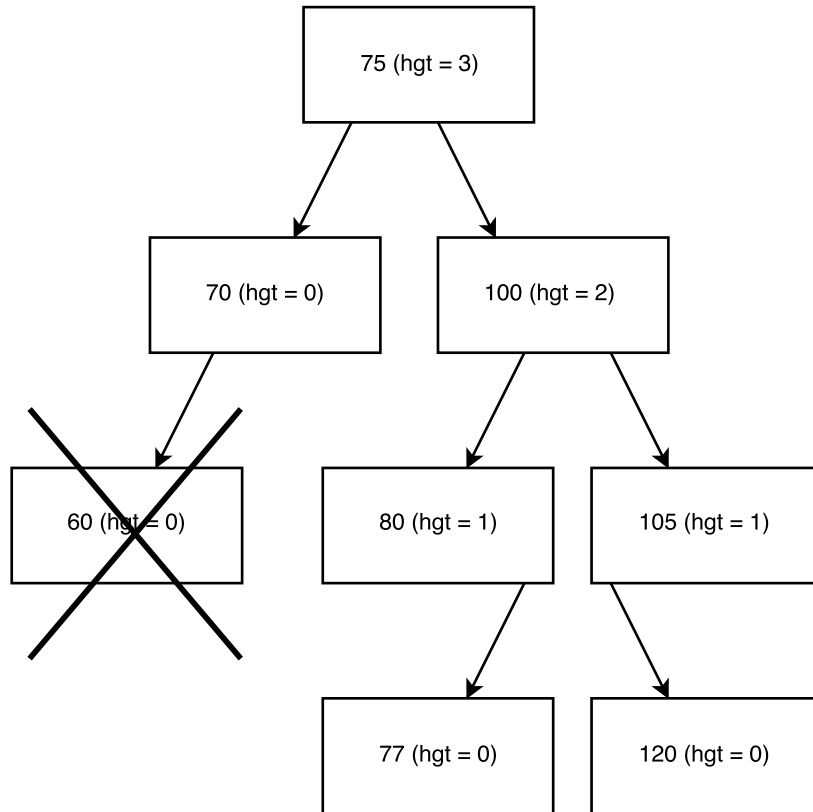

### Question 3

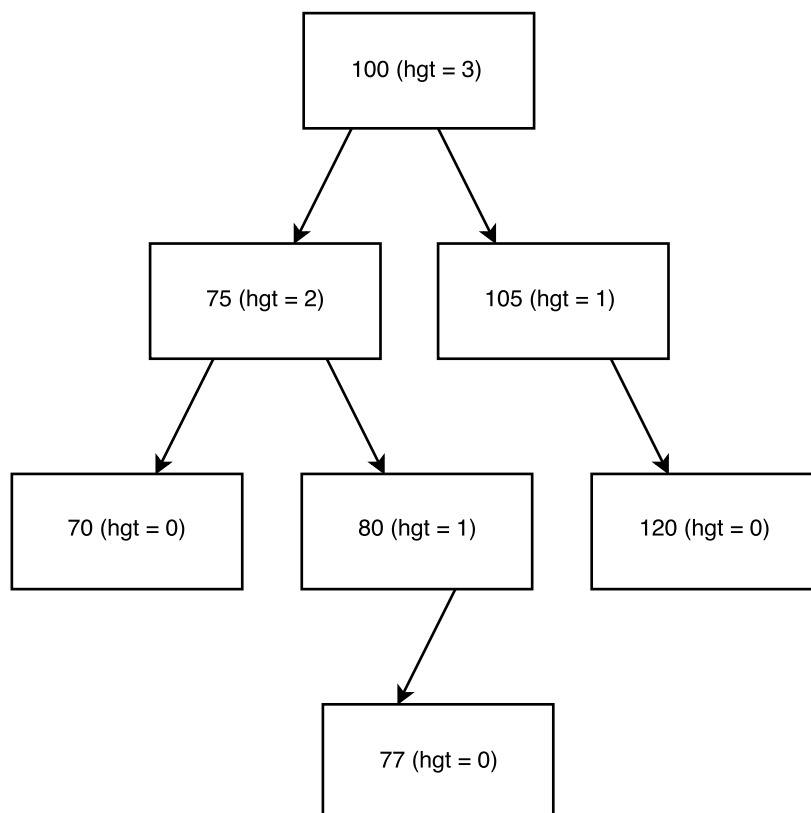

This is a balanced tree, nothing needs to be changed.

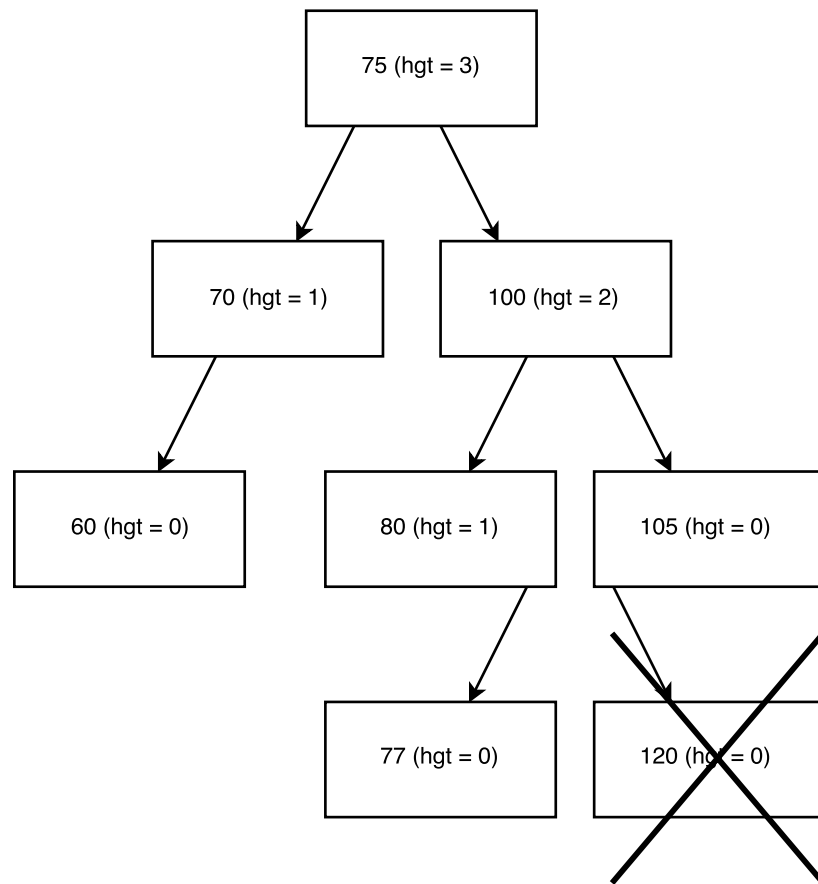

#### Question 4

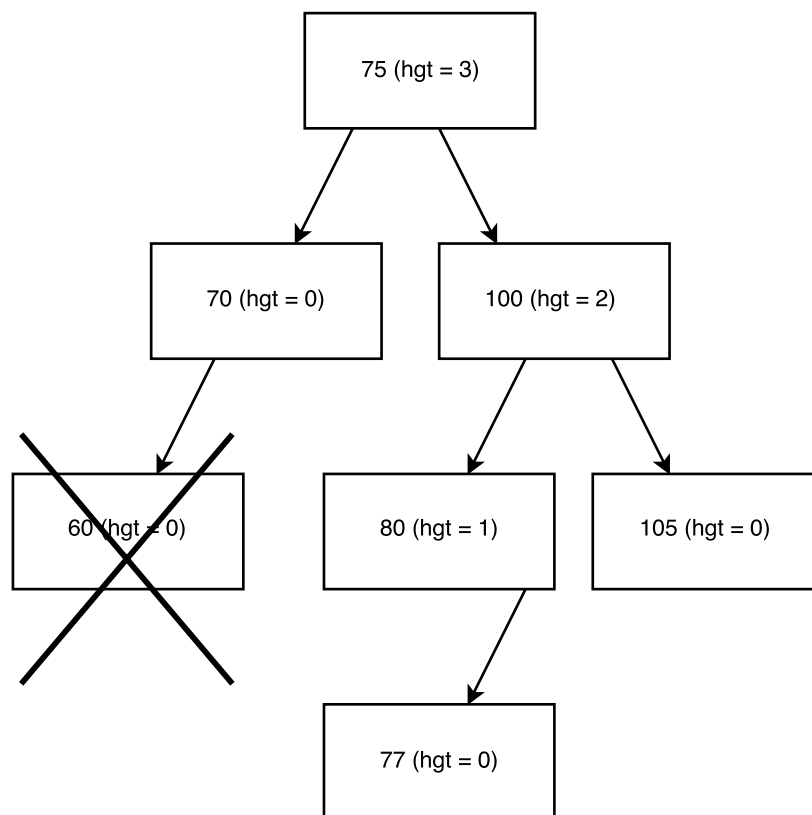

Removing the "60" makes the tree unbalanced.  
It is unbalance on the right subtree with both children of the same height 1.  
Hence, single rotation is applied.

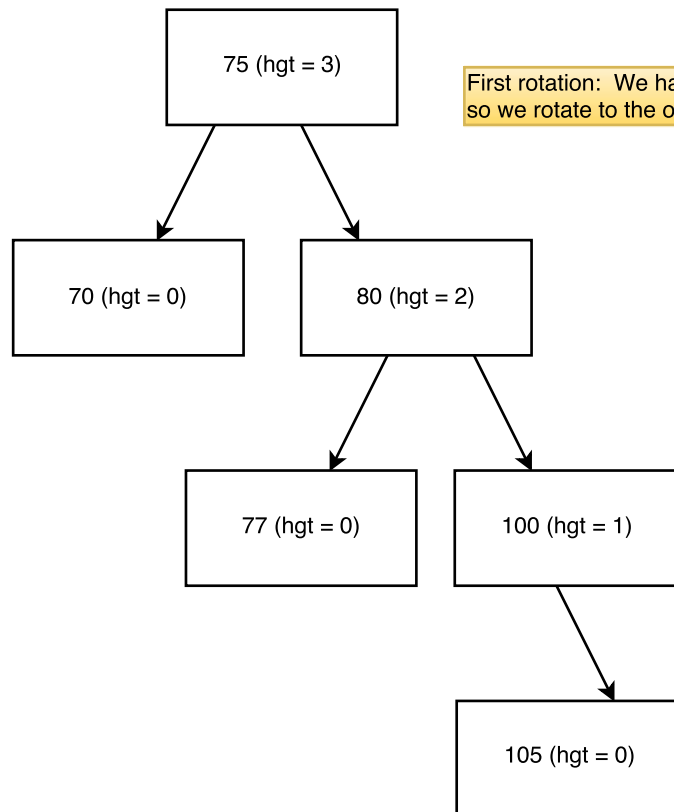

# Question 5

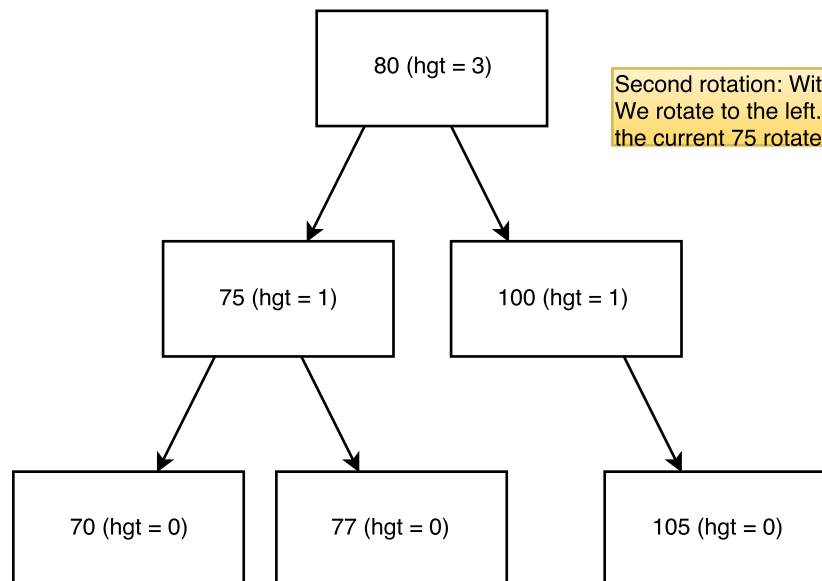

Nothing needs to be change when removing "120". This tree is still balance.

Removing "60" leads to an unbalance tree. Since the unbalance is from the right subtree with a left child. We need to implement double rotation here.

First rotation: We have heavier left child, so we rotate to the opposite direction (rotate right)

Second rotation: With unbalance right subtree. We rotate to the left. "80" becomes new top and the current 75 rotate to the current left.
